

Homing in your pc

You have an important meeting in the next few minutes when you suddenly realize that the power point presentation you made is lying on your home PC. Does the situation ring a bell? What would you have done? Perplexed? No, don't panic anymore as connecting to a remote PC becomes a reality.

It Does All...

We are talking about Mobiflexi app that allows you to remotely access your home PC from anywhere you are through your mobile. All you need is GPRS connectivity and your phone enables you to create, edit, attach any document that is lying somewhere else. Normally, in order to send a file across we either attach the file or paste a link on an email, but here all you have to do is to send a SMS with a URL to the person. Suppose you want to send an excel sheet to your colleague, all you have to do is to click on 'send SMS' with the URL, enter his mobile number and send.

How It Works?

It might sound complicated but

Ever wished if you could access your home PC on your cell phone?

Anannya Nath tells you how you could do just that and much more

actually it's pretty simple. Mobiflexi comes at a quarterly subscription of Rs 300. Install the CD, create your username and password that will be required whenever you want to access your PC remotely. Once done the user is all set to view his entire desktop on his handset.

Features Galore!

This app also enables you to transfer images, attachments, videos and other data from your cellphone to the remote PC. You can listen to all the songs stored in your PC through your phone! So no need to shellout more to get more memory for your phone. The solution allows the user to fax documents residing on the remote PC. The same goes

for printing documents too! A person sitting in Delhi can order a printout in Berlin right from his desk. He can just log onto to the desired computer with his password and get going. However, to achieve all these functionalities a strong GPRS connectivity is a prerequisite. In a country like India quality of GPRS connectivity is still an issue.

The developers claim that they are working on adding new functionalities to the solution and very soon it will be offered by all network operators. If this is the case then the operators need to work on providing better connectivity through phones. One ray of hope is the possibility of 3G and WiMax coming to India soon. If that happens, this app will truly redefine connectivity. Keeping your fingers crossed? So are we.
